- There was no clear grading methodology given for mini-projects. The instructors were confused as to whether the class is an algorithms class or a parallel programming class. Most students ended up never using parallel programming but still gaining higher marks than those who implemented parallel algorithms. For project 1, although we were told that performance/speed of the program will not count towards grade, the final scores included 30 points for 'performance' without any clear explanation on what it meant.

- The test cases for grading can be designed in a more reasonable way.

- The mini-challenge 3, was poorly prepared. Provided the instruction, a challenge more suitable to distributed computing should have been given.

I wish we could have talked more about alternatives to x10, especially hardware such as GPU.

- Grading was very harsh, heavily penalized for design requirements that were not made clear. Also, issues in code were often double penalized, as significant amount of points would be taken off both for making a poor design choice and also for the resulting poor performance from that choice. Overall, performance played too heavily into the process, as at times large performance gains came from making optimizations that have nothing to do with parallel programming. Additionally, there was a serious lack of course materials. A text book would be nice, but at the least materials covered should be posted in some way. Between the first and second midterms materials were only posted for two lectures.
